Key drivers of BMW resale value

Actual vs predicted prices

Executive takeaways

- **Vehicle age is the largest factor in resale price:** at 46% importance, the age of a BMW matters more than engine size, mileage, etc when determining its worth.
- **Used BMW prices sharply decline in the first 10 years:** the depreciation curve shows the steepest drop before year 10, after which prices tend to stabilize.
- **SUVs have a strong value retention:** X7, X6, X5, and X4 dominate the top 5 by average price, making the SUV segment the strongest long-term resale investment in the BMW lineup.
- **Higher mileage has a moderately negative correlation with price:** although mileage matters, it is not the dominant factor when buying a used BMW car, suggesting that age and model choice outweigh usage history in resale pricing.
- **Hybrid and electric BMWs demonstrate the highest average resale prices despite making up less than 2% of listings:** strong pricing potential as demand for alternative fuel vehicles continues to grow.
